

SENTINELX BUG AND FEEDBACK REPORT

Prepared: 27 September 2026 | Scope: Selenium TC-01 to TC-10 and manual test workbook review

1. Executive Summary

This report records issues discovered while reviewing and updating the SentinelX Selenium test suite and the available manual test cases. The review found four test-automation defects caused by changes in the user interface and access flow. No confirmed functional application defect is recorded in this report because the Selenium suite was not executed in this environment.

The manual workbook SentinelX_Manual_Test_Cases_NEW.xlsx contains documented authentication test steps with recorded Pass results. Selenium coverage is available for landing page, citizen login, invalid login, registration, crime reporting, consumer complaint, barcode verification, SOS, admin crime-statistics export, and the Sentinel Prime widget.

2. Test Evidence Reviewed

Automated scripts reviewed: TC-01 Landing Page Load; TC-02 Citizen Login; TC-03 Invalid Login; TC-04 Citizen Registration; TC-05 Crime Report Submission; TC-06 Consumer Complaint; TC-07 Barcode Verification; TC-08 SOS Emergency Beacon; TC-09 Admin Export Crime Stats; TC-10 SentiBot Widget.

Manual evidence reviewed: SentinelX_Manual_Test_Cases_NEW.xlsx. The visible authentication cases document expected and actual results for registration, duplicate-NID validation, valid/invalid login, forced password change, forgot password, role login, and session expiry.

3. Bug / Test-Automation Issue Log

BUG-01 | Medium | Resolved | Consumer Complaint test could not continue at Pricing step.

Observed cause: the default Price Gouging category requires Official MRP, Price Demanded/Paid, and a description. TC-06 supplied only the description. Resolution: added MRP 175 and paid price 205 before clicking Continue. Regression check: success receipt and tracking number are asserted.

BUG-02 | High | Resolved | SOS test selected the wrong SOS control.

Observed cause: a broad XPath located the overview quick-dispatch button rather than the SOS navigation tab. The test then could not find the beacon trigger. Resolution: scope the locator to the short-tabs navigation bar, resolve a previous active test beacon when present, confirm the modal, and assert the Tracking Beacon ID.

BUG-03 | High | Resolved | Admin export test used the public login flow.

Observed cause: the application intentionally blocks ADMIN accounts in the public Sign In form. Resolution: TC-09 opens `#/admin-clearance` and uses the authority key, admin email, and password before exporting. The test checks for a newly downloaded `sentinelx_crime_statistics` CSV file.

BUG-04 | Medium | Resolved | AI-widget test used retired visible labels.

Observed cause: the widget UI is now Sentinel Prime with an ONLINE badge; the old test searched for SentiBot and LIVE DB. Resolution: TC-10 opens the aria-label Open Sentinel Prime and verifies SENTINEL PRIME, ONLINE, and Civic & Legal Assistant.

4. Feedback and Improvement Recommendations

FB-01 | High | Add stable data-testid attributes to key controls.

Recommendation: add unique identifiers for Sign In, File Dispute, SOS tab, SOS trigger, SOS confirm, admin export, and AI assistant trigger. This reduces fragile XPath selectors and makes future Selenium maintenance easier.

FB-02 | High | Make the Admin Clearance route discoverable for authorized testing.

Recommendation: document the `#/admin-clearance` entry path and required demo credentials in the project test guide. The public login rejection is intentional, but a tester can otherwise mistake it for a failed admin login.

FB-03 | Medium | Provide test-data reset or cleanup support.

Recommendation: add a documented test reset procedure or seeded test accounts. Stateful flows such as SOS can leave active records that affect the next run.

FB-04 | Medium | Display an export-complete notification.

Recommendation: after CSV generation, display a short success toast with the generated filename. This improves user feedback and gives UI-level evidence beyond browser download verification.

FB-05 | Low | Preserve naming consistency for the AI assistant.

Recommendation: update test documents and manual sheets when SentiBot is renamed to Sentinel Prime. A small terminology register would prevent stale test labels.

5. Test Conclusion

The reviewed Selenium scripts have been aligned with the current user interface and business rules. Before final submission, run TC-01 to TC-10 against the running Flask backend and Vite frontend, attach screenshots for each pass/fail result, and update this report with the execution date, tester name, and final result totals.

Note: This report is based on code and workbook review. It does not claim browser-execution results that were not produced in this environment.
